

# naturelocator

---

**UK Butterfly Survey**

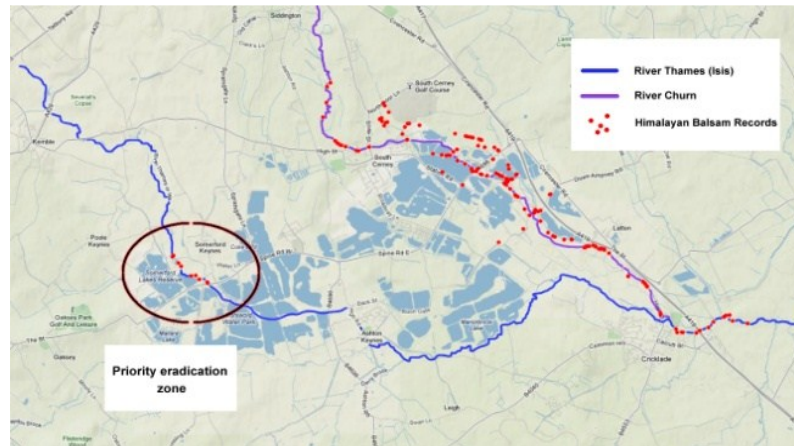

# What we do

- Work with **researchers** and **organisations** to engage the **public** with data collection
  - Design **bespoke smartphone applications**
  - **Innovate** to take the technology in new directions
  - Provide **data visualisation** tools to enhance feedback

# The Products

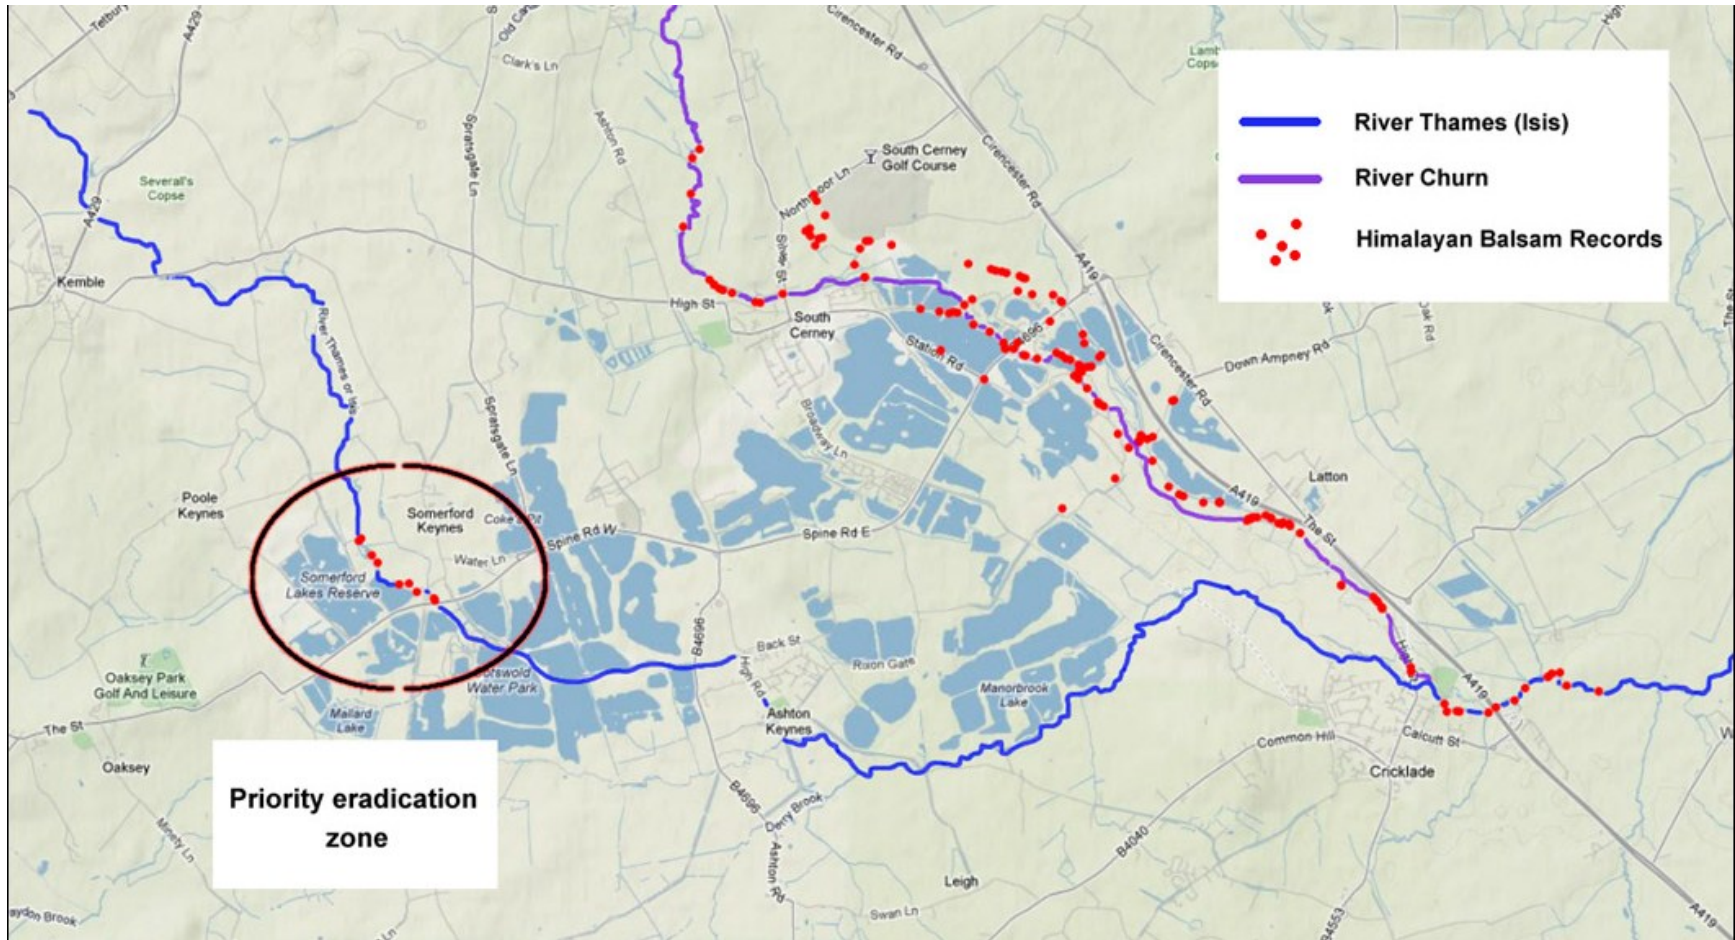

# How it works

# Making a difference

# Some statistics

## PlantTracker

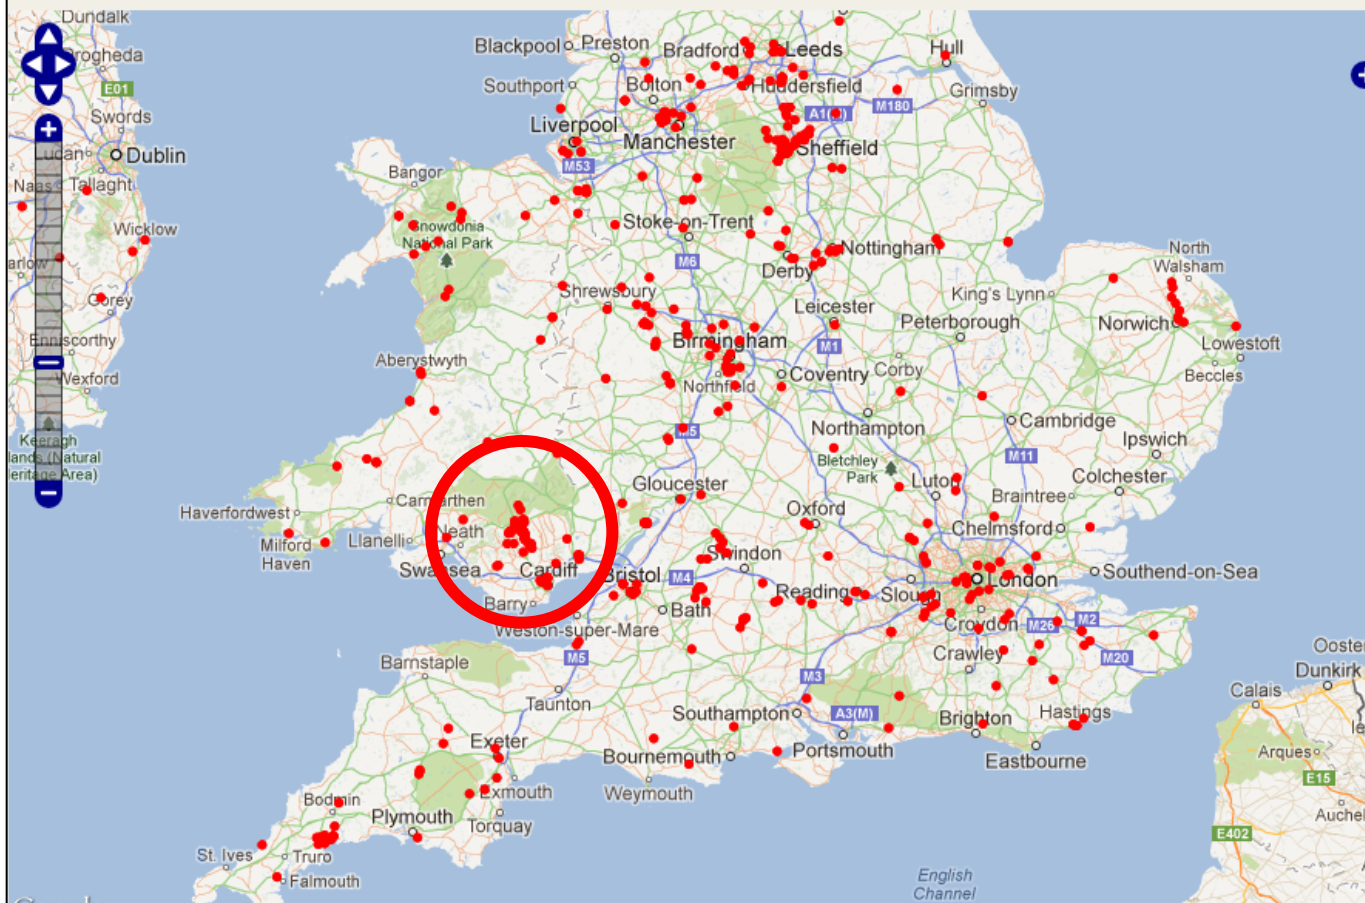

- 15,000 downloads
- 6,000 records of invasive species since Aug 2012
- Appearance on BBC Countryfile
- Data has already enabled early intervention
- Cost saving to the Environment Agency
- SNH and SEPA are new partners

# PlantTracker results

## Distribution of Japanese Knotweed reports

Note: Only verified records appear on the map

# And now for something different...

# BatMobile

Test if we could build an app capable of automatically identifying the UK's bat species from their ultrasonic calls

Collaboration with bat researchers @

- Institute of Zoology and UCL
- Bat Conservation Trust

# BatMobile project

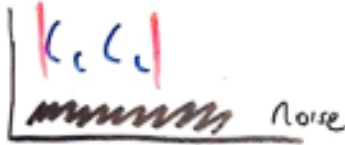

Services such as **SoundHound** and **Shazam** enable people to identify songs they hear, using a mobile app.

**BatMobile** aims to apply the same principle to identify species of bats from their ultrasonic calls.

20 kHz  
140 kHz

- ① Record .Wav  
high sample rate
  - ↓
  - ② Display via Sonogram s/w
  - ↓
  - ③ Enable Call Isolation
- 
- ④ Call Characterisation
  - ⑤ Pass to ANN

- ? How much on-phone?
- ? Approximate ID on-phone then  
Pass to Server for + accuracy?

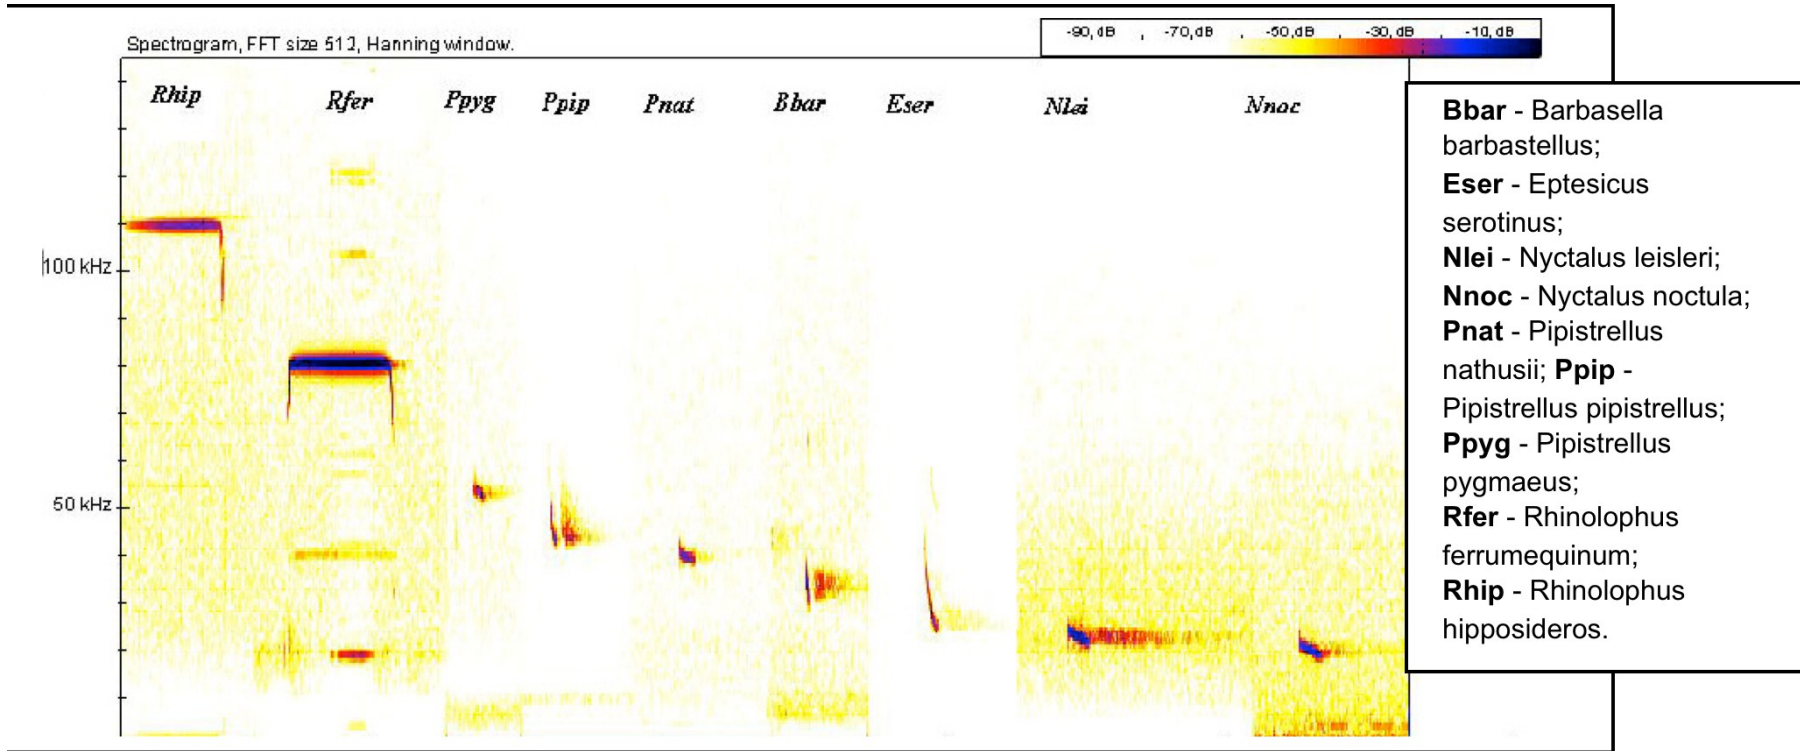

# Key Challenges

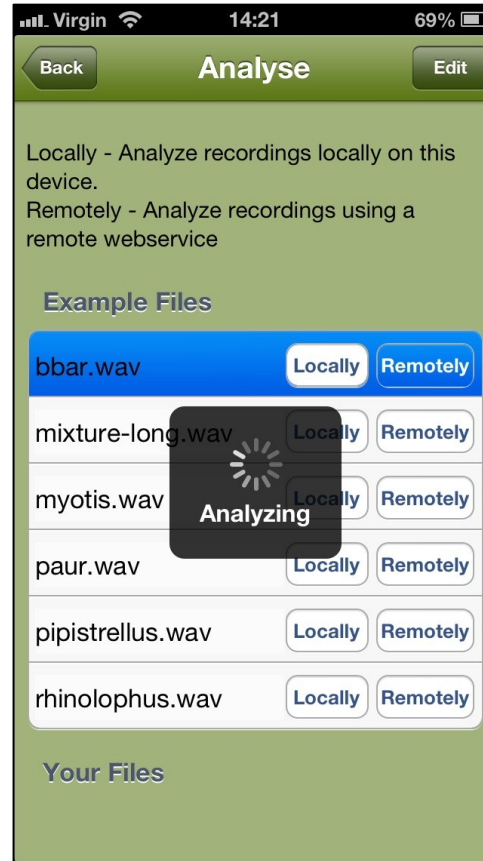

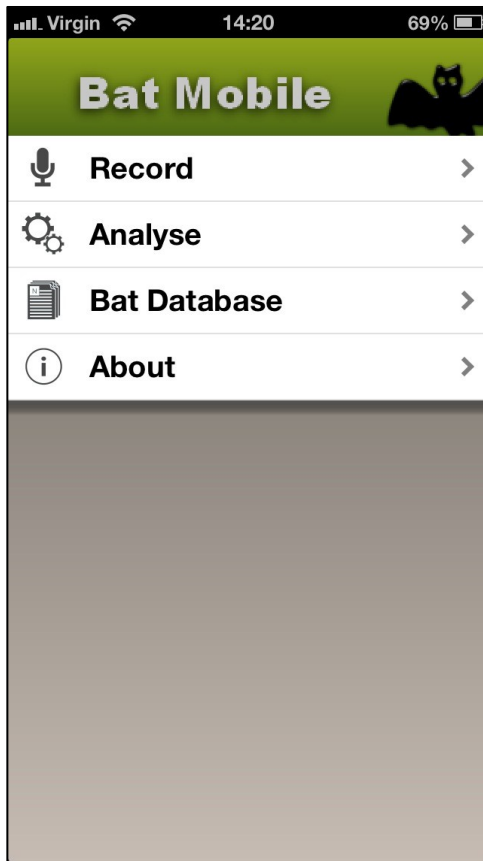

## Challenges:

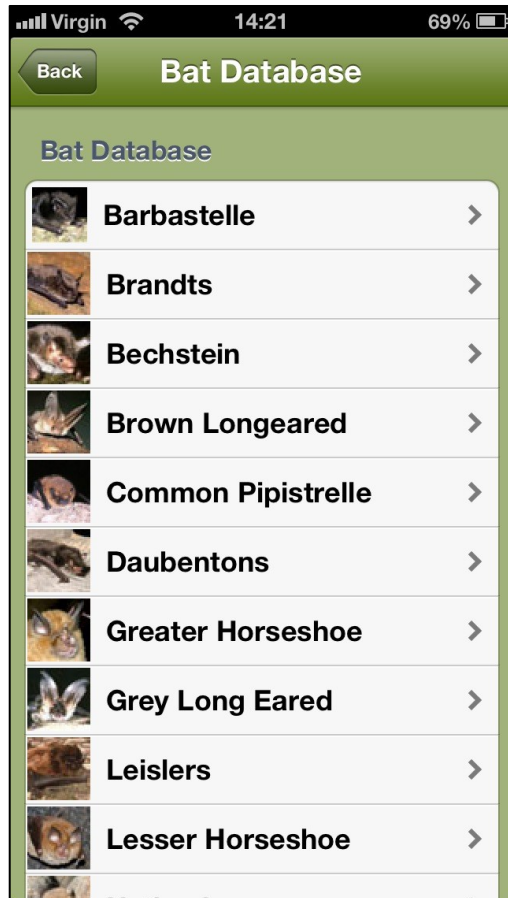

- Creating accurate algorithms to characterise bat species by call
- Creating accurate ID matrix
- Real time on a mobile
- Online vs. offline analysis
- Ultrasound => need a special microphone

# Identifying bats by their calls...

# BatMobile Screengrabs

# BatMobile Summary

- Current mobiles are up to the job
- However, bats are tricky since they use ultrasonic frequencies
- Some are trickier than others
- We need to work with a bat bio-acoustic specialist to enhance the feature extraction and ID element
- Currently also working on a project with the CEH to auto-id Orthoptera.

Why crowd sourcing/citizen science works for the public

Why it works for us

# Why it works for the public

- Immediacy
- Minimal effort
- Usability (paramount for public engagement)
- It appeals to the “geek” in us
- I can use my phone to do something useful...
- The apps are informative
- Feedback loop

# Why it works for us

- High quality data
  - Photo attached (verifiable... most of the time)
  - Geo-located
  - Other metadata
- Digital data
  - Data flow consistent (to BRC – iRecord - then to NBN)
  - No work converting it from another format
  - Accessible by anyone (potentially)
  - No time lag for data to appear in public domain

naturelocator  [Get in touch](#) 

We specialise in helping researchers and organisations collect crowd-sourced data for biological surveys

**Case study: LeafWatch**

- App available for iPhone and Android
- Over 5000 unique records collected in first season
- Featured on the BBC's The One Show, Radio 4, Sunday Times – even tweeted by Stephen Fry!

[Full details](#)

**How we could help your project**

- 

We work with you to design and build a custom phone app with a user-centred focus
- 

Participants download the app and go out into the field to collect photographic, geo-located records.
- 

Records are verified by nominated experts using an easy-to-use system. You get high quality, validated results!
